

Electronic Design and Manufacturing Services

There will be occasions when an off-the-shelf product will just not be suitable.

KMH Design is a specialist provider of electronic design and manufacturing services. We can provide custom designed solutions for one-off projects, as well as complete product development.

From prototypes to small quantity production runs, we can provide a competitive and flexible manufacturing service to suit your needs. Contracts can be accepted on a free issue basis or we can source the components for you.

Design time scales are dependent on your project requirements. Typically, for a custom designed project, we can design and manufacture equipment in 2 to 4 weeks. New product designs usually take longer due to the investigation of design ideas, sourcing components etc. Product design usually takes 1 to 3 months to complete.

With a custom designed project we will supply full user instructions concerning the operation of the equipment (in the form of a technical manual). For new product designs we will also supply complete circuit diagrams and a detailed parts list, together with any manufacturing documentation that may be required by your chosen manufacturer.

Cost is dependent on the requirements of each project. However, our rates compare very favourably over those of general industry design houses thanks to our small size.
